Profile

Detail-oriented Information Science Engineer with hands-on experience architecting modern Android applications using Kotlin, Jetpack Compose, and advanced API integrations. Proven track record of building user-centric, real-time tracking solutions and utilizing state management for seamless performance. Driven to deliver high-impact, scalable mobile solutions in fast-paced, collaborative product teams.

Education

B.E in Information Science and Engineering

Dayananda Sagar Academy of Technology and Management (CGPA: 7.71/10.00)

Nov 2022 - present

Bangalore, India

Experience

1. Android App Development Intern | MindMatrix.io

Jan 2026 – May 2026

- **Architected and developed VidyarthiBus**, a modern Android application utilizing Kotlin and Jetpack Compose to provide college students with real-time bus tracking and crowd-monitoring features.
- Integrated **Google Maps SDK** and leveraged **Kotlin Coroutines & StateFlow** to deliver live, low-latency GPS tracking and dynamic UI state updates during active student commutes.
- Designed and engineered a proximity-based reporting system using **Geofencing** to validate crowd-status updates and prevent fraudulent data submission.
- Optimized application workflows and established a robust manual route-management system linked to a localized alternative transportation directory.

Project and Research

1. Smart Text Analyzer and Translator | Python, Streamlit, Tesseract OCR, Google Translate API, MySQL

- Architected an end-to-end NLP pipeline using Python and Streamlit to automate text extraction from images with Tesseract OCR, achieving high-speed summarization using BART and T5 models
- Optimized model output quality by engineering and refining complex AI prompts, resulting in more concise summaries and context-aware translations via API integrations.
- Deployed the application using Pyngrok and exposed REST API endpoints to provide a secure, public URL for real-time user testing and seamless interface interaction
- Integrated a MySQL backend to securely log processed queries and metadata, ensuring data persistence and basic usage analytics.

2. Neonatal Health Predictor | React, Flask, Python, Scikit-Learn, REST API

- Developed an ML-backed web application predicting critical newborn conditions (**RDS, Jaundice, Sepsis**) from feature inputs.
- Trained and serialized a **Random Forest** classifier using Python, creating a data pipeline from raw dataset to persistent model storage.
- Formulated a structured **Flask API** architecture featuring a dedicated prediction endpoint to communicate seamlessly with a decoupled **React** frontend.
- Designed the UI to dynamically pair machine learning predictive outputs with authoritative medical guidance and external institutional links (WHO/CDC).

Skills

- **Languages:** Java, Python, HTML, CSS, SQL
- **Tools & Frameworks:** Streamlit, Tesseract OCR, Git, GitHub, VS Code.
- **Soft Skills:** Critical Thinking, Communication Skills, Collaboration & Teamwork, Time Management.

Certifications

- Database and SQL for Data Science with python – Coursera, IBM
- Data Structures and Algorithms - Infosys Springboard
